

Hospitality WiFi

Improving the guest experience

A trouble free guest WiFi experience is essential to guest satisfaction. But an improperly installed system is a headache to hoteliers. The quality guest WiFi systems from Technology At Work cure that headache through careful design, meticulous installation and exceptional aftercare.

COMPLETE COVERAGE - Our designs provide complete overlapping coverage of your property, eliminating dead spots. Using an appropriate combination of outdoor and indoor WiFi access points we can assure 100% coverage. Unlike consumer grade WiFi, our commercial grade access points are significantly higher in power, are highly reliable and designed specifically for this type of service.

ACCESS CONTROL - By controlling access with our Guest Internet Firewall, use of your WiFi system is reserved for guests and not the neighbors. Speed sapping applications are controlled and bandwidth is shared among all users. Our firewall provides a long list of features essential to a great guest experience.

HIGHSPEED CONNECTION - We work with your internet service provider, such as your telephone or cable company, to order and/or optimize your connection for the best performance. We speak their language and can cut through the confusion and get you online.

GUEST CARE - With the careful design, meticulous installation and quality components guests receive the quality Internet experience they expect. However, if there is a problem we provide 24/7 support and will assist your guests in getting online.

Contact Technology At Work today and give your guests the WiFi experience they expect.
